

Chinese website hosting service

Our Chinese hosting sits at a critical intersection between international networks and Chinese internet infrastructure, allowing full access to the Chinese NS/DNS network.

Our services are split between mainland China and Hong Kong. No Chinese ICP certificate is required.

Access to China website hosting service allows your business to be seen in China.

Optimised for the Chinese internet

Historically, internet costs for international connectivity in China have been too high to support international websites seeking visibility there. Over the years, we have been working with Chinese ISPs to develop services and reduce network costs.

- Fastest access to the Chinese internet – under 35ms
- Access to the local region network from India to Japan, through to Australia. The service gives access to 60% worlds consumers and businesses – under 75ms

Chinese domain names and DNS support

In 2022, the Chinese authorities allowed overseas businesses to register domain names in China. In doing so, Chinese authorities grant access to the domain name via the local NS/DNS service, which you need if your website is going to be seen in China.

- Access to your Domain name – under 30ms
- Access to the local region network from India to Japan, through to Australasia – under 50ms
- Worldwide – under 175ms

The Chinese Name server (NS) is a national service across China built for speed and very high traffic volumes. Having access to Chinese NS will give your website a big boost in China.

Access beyond China

Our services give fast access beyond China throughout Asia and Australasia. From India to Japan, down to Australia and New Zealand.

60% of the world's population lives in these regions.

Adding a Chinese translation of key information, such as SEO data, will provide access to Chinese-speaking individuals worldwide, including in California.

Chinese Internet Content Provider (ICP) Licensing

Our services are split between mainland China and Hong Kong. Both services have the same response times in China. The changes in our ISP services enable us to achieve this.

While we do not need ICP to operate your services, we ask that businesses using our service comply with Chinese publishing rules. Most businesses met Chinese publishing rules without making any changes.

Making changes to your website

While our hosting service is not blocked in China, some of your website content may be blocked there, particularly third-party content such as Google files and social media links.

Full list: please see "Improving Website Performance in China."

Another option is our "Dynamic Website" service, which updates your current website for the Chinese market via proxy services. This can include SEO Chinese translation.

For our Dynamic Website Service

Why use our services

Very few companies, if any, offer this type of service to overseas businesses; fast access to both the Chinese internet and local NS service, combined with ICP licensing in China.

Many hosting providers have services in Hong Kong. Most access to the Chinese internet is via the international internet back through the USA (over 175ms). This is normal internet in Asia.
